Fischer Identity Recognized in the 2026 Gartner® Market Guide for Identity Governance and Administration

NAPLES, FLORIDA – September 22, 2026 – Fischer Identity, a leading provider of identity governance and administration (IGA) solutions, has been recognized in the 2026 Gartner® Market Guide for Identity Governance and Administration.

"Being recognized in the Gartner Market Guide is significant for Fischer Identity because we believe it validates our longstanding approach to identity governance: organizations need control, visibility and the ability to adapt as their identity environments change," said Bryan Leber, CEO of Fischer Identity. "The identity landscape has become dramatically more complex as human identities are joined by service accounts, workloads and AI agents. Our focus remains on giving organizations a practical way to govern that complexity without forcing them into years of customization, expensive consulting engagements or dependence on outside resources to manage their own IAM environment."

The recognition comes at a time when identity governance is moving well beyond its traditional role as a periodic compliance exercise. Organizations must increasingly govern access across a diverse population of employees, contractors, partners, service accounts, workloads and emerging AI-driven identities, while maintaining visibility and control across complex cloud, hybrid and on-premises environments.

For Fischer Identity, these changing needs reinforce a direction the company has focused on for years: identity governance should provide organizations with continuous operational oversight and governance without creating another layer of technical and administrative complexity.

Identity Governance Built for Continuous Change

The changing IGA landscape places greater emphasis on governance that can respond as identities, roles, relationships and access requirements change, rather than relying solely on point-in-time reviews.

Fischer Identity addresses these challenges through a comprehensive, no-code IAM platform that enables organizations to automate identity lifecycle management and access governance while maintaining administrative control over their environment.

Fischer Identity's capabilities include:

- **Automated identity lifecycle management** to provision, modify and remove access as roles and relationships change.
- **Identity governance and access certification** to provide greater visibility into who or what has access to enterprise resources.
- **No-code configuration** that allows organizations to adapt workflows, policies and business rules without extensive and expensive custom development.
- **Human and non-human identity governance** to address the expanding population of identities operating across modern enterprises.
- **Cloud and hybrid integration** to govern access across complex combinations of cloud, SaaS and on-premises systems.
- **Continuous governance and audit visibility** to help organizations identify inappropriate access and support regulatory and compliance requirements.
- **Customer administrative control** that enables organizations to manage and modify their IAM environment without relying on vendor support tickets or ongoing systems integrator engagements.

Fischer Identity has delivered identity solutions to complex organizations for more than 20 years, including institutions in higher education, healthcare, financial services, government, manufacturing and other industries where identity governance, security and regulatory compliance are critical operational requirements.

"The definition of identity is changing, but the underlying governance question remains the same: who or what has access, why do they have it, and should they still have it?" Leber added. "Whether that identity belongs to an employee, contractor, service account or AI agent, organizations need to be able to answer those questions confidently and act when something changes."

As AI agents and other non-human identities become increasingly integrated into enterprise operations, Fischer Identity continues to expand its approach to governance around a fundamental principle: every identity with access to organizational systems, applications or data must be visible, accountable and governed throughout its lifecycle.
